

Hardware.Info Wallpaper specification 2016

- Wallpapers should be 2560x1600 pixels to fit on almost all screen resolutions. Use 3840x2160 to also target 4K (Ultra HD) screens.
- Hardware.Info site width is 1050 pixels. Everything behind the middle 1050 pixels of your wallpaper will be invisible.
- The upper 50 pixels of the wallpaper are only visible when the user scrolls, due to the menu bar. Don't put text or important elements here.
- Readable elements should ideally be put within 1600 pixels width, to be visible on most screens.
- The block within 1010 pixels from the middle and the 51st until the 385th pixel row is visible behind the banner and the search bar. This part should have a single color or at least no distracting elements, unless the wallpaper is booked together with an accompanying leaderboard/billboard campaign.
